

CLF Sistema de Gestion

One-page repo-backed application summary

CLF Sistema de Gestion is a Python/Tkinter desktop app for commercial operations, centered on quotations, inventory, purchases, invoicing, and account tracking. Repo evidence also shows multi-company selection, per-company databases, PDF generation, and document linkage workflows.

Primary user/persona: an internal sales, operations, or admin user at a trading company who needs to quote, buy, receive, invoice, and follow collections from one desktop system.

- Open 'Gestion-CLF'.
- Use a local Python 3 installation. Dependency manifest or install guide: Not found in repo.
- Run 'python main.py'.
- On first use, sign in with 'admin / admin123', then choose a company.
- Role-based login with a central users database and seeded first-use admin account.
- Company selector with stored company metadata and separate database paths.
- Quotation, delivery, and account-status workflows with PDF output for quotations.
- Inventory controls with stock movements, low-stock alerts, and ABC analysis.
- Purchase and supplier management backed by company-level records.
- CFDI XML import/parsing plus invoice-to-quotation or invoice-to-purchase linking.
- Dashboard KPIs and a linkage center for missing clients, suppliers, products, or invoice relationships.
- UI shell: 'main.py' starts Tkinter and loads sections from 'ui/' and 'modules/'.
- Startup flow: login in 'ui/login.py', then company selection in 'selector_empresa.py', then 'SistemaGestion'.
- Data: 'db_init.py' boots the SQLite company schema; 'db_connection.py' switches between SQLite and PostgreSQL from 'config.json'.
- Documents: quotation PDFs are handled in 'ui/generador_pdf_cly.py'; CFDI XML parsing lives in 'modules/facturacion.py'; missing links are detected in 'modules/vinculacion.py'.
- Data flow: user action in Tkinter -> DB read/write -> optional PDF/XML document processing -> refreshed dashboard/section views.
